Elementary Graph Algorithms

RangeQuery → Segment tree.

BFS tree:

discover white node → tree edge.

* backedge + grey node = cycle

* Leads to black node → backedge

Forward edge → leads to descendent

12. for each $v \in G.Adj[u]$

$\hookrightarrow O(V+E)$

For Adj Matrix it would be

expensive → $O(V)$

started after me finished before me.

dRS → ch 22
