Quiz # 3 **Time: 20 min**

1. A grayscale image of size **64 × 64 × 1** is passed through the following layers sequentially: --8
    i. **Conv Layer 1**: 16 filters, kernel size = 5×5, stride = 1, padding = 'same'
    ii. **Max Pooling Layer 1**: pool size = 2×2, stride = 2
    iii. **Conv Layer 2**: 32 filters, kernel size = 3×3, stride = 1, padding = 'valid'
    iv. **Max Pooling Layer 2**: pool size = 2×2, stride = 2

(a) Compute the output shape after each layer.

(b) What is the total number of trainable parameters in the above architecture (Conv Layer 1, Pooling Layer 1, Conv Layer 2, and Pooling Layer 2)?

(c) What is dense layer?

2. A neural network has the following: --7
   - Input: 3 neurons
   - Hidden layer: 2 neurons with **tanh** activation
   - Output layer: 1 neuron with **sigmoid** activation

Given:

$$\mathbf{x} = \begin{bmatrix} 1 \\ 2 \\ -1 \end{bmatrix}, \quad W^{[1]} = \begin{bmatrix} 0.5 & -1 & 2 \\ -2 & 1 & 0 \end{bmatrix}, \quad b^{[1]} = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

$$W^{[2]} = \begin{bmatrix} 1 & -1 \end{bmatrix}, \quad b^{[2]} = 0$$

Compute the final output (probability) of the network.
