Before:

Doughnut shaped ferromagnetic loop → core

Now:

Semiconductor → Basic element Memory cell.

Write operation:

bit line give high/ low voltage + transistor switched on.

Read operation:

transistor switched on.

↳ charge flow from cap to bit line

then A SENSE AMPlifier.

↳ which compares the voltage to a reference value to determine whether cell logic → 1/0.

↳ cap discharged → So recharged again before completing operation.
